

AMOS WS21/22 Project #NftTheWorld!

Project name	NFT Development
Project mission	The mission of this project is to create a reusable example application which manages NFT drops and automatizes important steps in order to facilitate earning money with own NFTs. As an open source project, the result can be used by individuals and companies, to easily create and provide NFT sales for their own marketing strategies, metaverses, profit or online campaigns for several non- or commercial purposes.
Industry partner	Adorsys
Team logo	
Project summary	<p>NFT The World supports three different kinds of user types. Admins are able to access all functionalities, whereas verified partners are able to create drops and create announcements, but are not allowed to interact with user management or access rights. Users are not able to create drops, but join them. All users are able to view their personal profile, see their assets, change their settings, and connect their Ethereum wallet.</p> <p>The smart contracts which are deployed on the testnet Kovan include various checks to prevent exploitation. A user is only able to reserve up to 5% of all NFTs of the drop and only see the assigned NFT after the purchase.</p> <p>We use Appwrite as a backend solution to facilitate provision of a secure and functional user and data management system. All the services are dockerized and are easily scalable.</p>
